

Teach your developers everything they need to know about web application security, so they can ensure the apps they develop function as they should, even when under attack.

Training Outline

Web Applications Secure Code Training

CybergymIEC's Web Applications Secure Code training will teach your developers about the risks around secure web app development, and how to avoid them.

This lecture includes examples, demonstrations, and recommendations based on the OWASP top 10 vulnerabilities – including injection, broken authentication and sensitive data exposure. It also covers additional security risks, such as input and data validation, configuration management and session management.

Participants

- Developers

Prerequisites

- Understanding of basic information security concepts and tools
- Familiarity with networking principles, architecture and protocols
- Familiarity with different development languages

Training Outcomes

- Understanding the secure development activity in the organization

Duration

- 3 hours
